

DISINFECTION LAYERS

We offer a layered approach to disinfection that provides businesses with the most comprehensive defense against Covid-19.

Surfaces disinfection

Disinfection with the use of medical and industrial grade equipment of both hard and porous surfaces. We go the extra step in providing the most comprehensive service with our addition of the use of HEPA vac's and steam cleaners. This in turn, provides businesses with the assurance of knowing all surfaces within their facility or office are free from infection.

UV disinfection

Due to the biggest threat of Covid-19 infection being air borne droplets that can stay alive and in the air for up to 8 hours, UV disinfection is a must to protect your office or facility. We use UVC air sanitizers and HEPA hogs to guarantee that the air your customers and employees' breath is safe and free from infection.

Post disinfection ATP testing

We offer ATP testing, a vital line of defense against the virus. The testing measures levels of cleanliness of different surfaces within your business, eventually achieving the standard of hospital grade cleanliness (100 or below). Our ATP tests provide businesses with the assurance of knowing that their office or facility is hospital grade clean, as defined by the medical association. We also have the capability of testing surfaces within your office or facility for the presence of Covid-19.

**ASSURED
DISINFECTION.
MEASURED
RESULTS.**

Proprietary COVID-19 Contamination Analysis

Real-Time Surface Sanitation & Cleanliness Data

Measured RLU (Relative Light Units) Cell Emission

Medical-Industrial Grade Technician and Employee PPE

Assured ATP levels below 100 (*Hospital grade cleanliness)
